Sonoff ZbBridge Commands

ZbName

This command can be used to give nicknames to the zigbee devices to be used instead of their HEX-value names.

Example:

```
ZbName 0x8C19,osram_bulb
```

This gives the nickname *osram_bulb* to the devices identified by *0x8C19*.

ZbSend

With this command you can send information in JSON format to a zigbee device.

Example:

```
ZbSend {"device":"osram_bulb","Send":{"AddGroup":100}}
```

By using this command the zigbee device identified by *osram_bulb* is added to the zigbee group 100. You can also use the HEX-value device ID instead of the nickname.
